

MORE TOOLS HAVE NOT GIVEN YOU MORE VISIBILITY

Which identities touched PHI last night?

Your posture stack keeps growing, yet each tool still sees only its own slice. **None of them can tell you whether an identity's behavior was normal.** That's where real risk lives in a federated health system. CINQUE is the correlation layer above the tools you already own. It learns how every persona (human, non-human, and AI) behaves across **Identity, Device, Network, Application, and Data**. CINQUE turns scattered alerts into a short list of observable risks that actually need you.

FIVE THREADS. ONE FABRIC.

- IDENTITY
- DEVICE
- NETWORK
- APP
- DATA

AI SECURITY MEANS TWO THINGS

Every tool now says it has AI security. It helps to separate what that can mean.

AI FOR SECURITY

What every tool now claims

Machine learning added to a product to score, cluster, or summarize its own alerts. Useful, but it is still one tool looking at one slice, and it cannot tell you whether an action **should have happened**.

SECURITY FOR THE AI YOU RUN

The part most tools skip

Your environment now runs copilots, service accounts, and autonomous agents that reason and expand scope at runtime. The first question is simple: **can you even see them, and what they can reach?**

CINQUE is AI-native, and it makes the AI already inside your environment **visible and contextual**. Shadow AI, agents, and rogue service accounts show up as personas with observed behavior, measured against what is normal for that identity.

Detection tells you what happened. Context tells you whether it was supposed to happen.

MAPPED TO WHERE HIPAA IS HEADING

PROPOSED HIPAA SECURITY RULE REQUIREMENT	WHAT CINQUE'S CONTEXTUAL VISIBILITY GIVES YOU
Maintain a technology asset inventory, refreshed on a set cycle	→ CINQUE discovers the personas actually active in your environment, human, non-human, and AI, from observed behavior rather than stale directory data.
Keep a network map showing how ePHI moves	→ It correlates activity across Identity, Device, Network, Application, and Data into one journey per persona, so you can see where sensitive access concentrates.
Account for AI software that can reach ePHI	→ Shadow AI, autonomous agents, and rogue service accounts surface as first-class personas, not blind spots between tools.
Produce evidence you can stand behind at audit	→ Dozens of scattered signals become a short list of correlated, business-contextualized risk stories you can attest to.

Based on the HHS Office for Civil Rights proposed 2025 update to the HIPAA Security Rule. Proposed, not final. Requirements may change, but the direction toward asset inventory, ePHI mapping, and continuous verification is clear.
